## Standard Data Types

- ▶ Python has five standard data types-
  - ▶ Numbers
  - ▶ Boolean
  - ▶ String
  - ▶ List
  - ▶ Tuple
  - ▶ Dictionary
  - ▶ Set

## Lists

- ▶ A list contains items separated by commas and enclosed within square brackets ([ ]). To some extent, lists are similar to arrays in C. One of the differences between them is that all the items belonging to a list can be of different data type.
- ▶ The values stored in a list can be accessed using the slice operator ([ ] and [:]) with indexes starting at 0 in the beginning of the list and working their way to end -1. The plus (+) sign is the list concatenation operator, and the asterisk (\*) is the repetition operator.

```
list = [ 'amp', 4624 , 3.14, 'python', 0.07 ]
```

```
tinylis = [420, 'abcd']
```

```
print (list)
```

```
print (list[0])
```

```
print (list[1:3])
```

```
print (list[2:])
```

```
print (tinylis * 2)
```

```
print (list + tinylis)
```

## LIST

Function	Description
all()	Return True if all elements of the list are true (or if the list is empty).
any()	Return True if any element of the list is true. If the list is empty, return False.
enumerate()	Return an enumerate object. It contains the index and value of all the items of list as a tuple.
len()	Return the length (the number of items) in the list.
list()	Convert an iterable (tuple, string, set, dictionary) to a list.
max()	Return the largest item in the list.
min()	Return the smallest item in the list
sorted()	Return a new sorted list (does not sort the list itself).
sum()	Return the sum of all elements in the list.

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

```
▶ fruits = ['orange', 'apple', 'pear', 'banana', 'kiwi', 'apple', 'banana']
>>> fruits.count('apple')
>>> fruits.count('tangerine')
>>> fruits.index('banana')
>>> fruits.index('banana', 4)
>>> fruits.reverse()
>>> fruits
>>> fruits.append('grape')
>>> fruits
```

## Tuples

- ▶ A tuple consists of a number of values separated by commas. Unlike lists, however, tuples are enclosed within parenthesis.
- ▶ The main difference between lists and tuples are – Lists are enclosed in brackets ( [ ] ) and their elements and size can be changed, while tuples are enclosed in parentheses ( ( ) ) and cannot be updated. Tuples can be thought of as **read-only** lists.

```
tuples = ( 'amp', 4624 , 3.14, 'python', 0.07 )
```

```
tinylis = (420, 'abcd')
```

```
print (list)
```

```
print (list[0])
```

```
print (list[1:3])
```

```
print (list[2:])
```

```
print (tinylis * 2)
```

```
print (list + tinylis)
```

6

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

```
>>>my_tuple = ('p','e','r','m','i','t')
```

```
>>>print(my_tuple[0])
```

```
>>>print(my_tuple[5])
```

```
# nested tuple
```

```
>>>n_tuple = ("mouse", [8, 4, 6], (1, 2, 3))
```

```
>>>print(n_tuple[0][3])
```

```
>>>print(n_tuple[1][1])
```

7

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

#### Negative Indexing

```
>>>my_tuple = ('p','e','r','m','i','t')
```

```
>>>print(my_tuple[-1])
```

#### Slicing

We can access a range of items in a tuple by using the slicing operator - colon ":".

```
>>>my_tuple = ('p','r','o','g','r','a','m','i','z')
```

```
>>>print(my_tuple[1:4])
```

```
>>>print(my_tuple[:-7])
```

```
>>>print(my_tuple[7:])
```

```
>>>print(my_tuple[:])
```

7/4/2018

8

```
>>>my_tuple = (4, 2, 3, [6, 5])
```

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

```
# we cannot change an element
# you will get an error:
# TypeError: 'tuple' object does not support item assignment
```

```
>>>my_tuple[1] = 9
```

```
# but item of mutable element can be changed
```

```
>>>my_tuple[3][0] = 9
```

```
# tuples can be reassigned
```

```
>>>my_tuple = ('p','r','o','g','r','a','m','i','z')
```

```
>>>print(my_tuple)
```

## del

The del statement

CODE:

```
>>> a = [-1, 1, 66.25, 333, 333, 1234.5]
```

```
>>> del a[0]
```

```
>>> a
```

```
>>> del a[2:4]
```

```
>>> a
```

```
>>> del a[:]
```

```
>>> a
```

```
>>> del a
```

```
>>> print(a)
```

## Dictionary

- ▶ Python's dictionaries are kind of hash-table type. They work like associative arrays or hashes found in Perl and consist of key-value pairs. A dictionary key can be almost any Python type, but are usually numbers or strings. Values, on the other hand, can be any arbitrary Python object.
- ▶ Dictionaries are enclosed by curly braces ({ }) and values can be assigned and accessed using square braces ([]).
- ▶ `dict = {}`
- ▶ `dict['one'] = "This is one"`
- ▶ `dict[2] = "This is two"`
- ▶ `tinydict = {'name': 'john', 'code': 6734, 'dept': 'sales'}`
- ▶ `print (dict['one'])`
- ▶ `print (dict[2])`
- ▶ `print (tinydict)`
- ▶ `print (tinydict.keys())`
- ▶ `print (tinydict.values())`

11

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

Method	Description
<code>clear()</code>	Remove all items form the dictionary.
<code>copy()</code>	Return a shallow copy of the dictionary.
<code>fromkeys(seq[, v])</code>	Return a new dictionary with keys from seq and value equal to v(defaults to None).
<code>get(key[,d])</code>	Return the value of key. If key doesnot exit, return d (defaults to None).
<code>items()</code>	Return a new view of the dictionary's items (key, value).
<code>keys()</code>	Return a new view of the dictionary's keys.
<code>pop(key[,d])</code>	Remove the item with key and return its value or d if key is not found. If d is not provided and key is not found, raises KeyError.
<code>popitem()</code>	Remove and return an arbitrary item (key, value). Raises KeyError if the dictionary is empty.
<code>setdefault(key[,d])</code>	If key is in the dictionary, return its value. If not, insert key with a value of d and return d (defaults to None).
<code>update([other])</code>	Update the dictionary with the key/value pairs from other, overwriting existing keys.
<code>values()</code>	Return a new view of the dictionary's values

## Set

- ▶ A set is a collection which is unordered and unindexed. In Python sets are written with curly brackets.

14

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

## Python Set Methods

Method	Description
<code>add()</code>	Add an element to a set
<code>clear()</code>	Remove all elements from a set
<code>copy()</code>	Return a shallow copy of a set
<code>difference()</code>	Return the difference of two or more sets as a new set
<code>difference_update()</code>	Remove all elements of another set from this set
<code>discard()</code>	Remove an element from set if it is a member. (Do nothing if the element is not in set)
<code>intersection()</code>	Return the intersection of two sets as a new set
<code>intersection_update()</code>	Update the set with the intersection of itself and another
<code>isdisjoint()</code>	Return True if two sets have a null intersection
<code>issubset()</code>	Return True if another set contains this set
<code>issuperset()</code>	Return True if this set contains another set
<code>pop()</code>	Remove and return an arbitrary set element. Raise <code>KeyError</code> if the set is empty
<code>remove()</code>	Remove an element from a set. If the element is not a member, raise a <code>KeyError</code>
<code>symmetric_difference()</code>	Return the symmetric difference of two sets as a new set
<code>symmetric_difference_update()</code>	Update a set with the symmetric difference of itself and another
<code>union()</code>	Return the union of sets in a new set
<code>update()</code>	Update a set with the union of itself and others

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

## Set Union

```
# initialize A and B
A = {1, 2, 3, 4, 5}
B = {4, 5, 6, 7, 8}
# use | operator
print(A | B)
```

7/4/2018

16

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

## Set Intersection

```
# initialize A and B  
A = {1, 2, 3, 4, 5}  
B = {4, 5, 6, 7, 8}  
# use & operator#  
print(A & B)
```

7/4/2018

17

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

## Set Difference

```
# initialize A and B  
A = {1, 2, 3, 4, 5}  
B = {4, 5, 6, 7, 8}  
print(A - B)
```

7/4/2018

18

Prof.Amar Panchal | 9821601163 | [www.amarpanchal.com](http://www.amarpanchal.com)

## Set Symmetric Difference

```
# initialize A and B  
A = {1, 2, 3, 4, 5}  
B = {4, 5, 6, 7, 8}  
print(A ^ B)
```
