Student management system

The system has a backend database and front end GUI using which one can add details like student name, students address, date of birth, contact.(auto generate student registration details)

One should be able to add details, edit, update and if needed remove student from Student information from the system. The system would have extensive search in which given area all student belonging to a particular area or given a branch should be list down student contact and address. (Field can be user selected).

Sell survey system

The system will be taking data about sell(any data set would do) which includes product quantity price this software should be able to store this information and later when needed should be able to provide various search which includes maximum sale, maximum product selling ,record and provide details in percentage in terms of growth, sell, age group buying.

Chat system-(Networking project)

We need a system in which we need communication between client and server using encryption where client and server would share a secret key and the remaining conversation will be only seen after proper insertion of the key.

Inventory management

Developer basics system in any scenario where we would include certain spares products with certain x or y quantities and system should be able to generate a text file for reordering on basis of processing of new orders or in order to show current orders.

The current systems would be allowed to accept orders using a g u i update orders delete orders and also auto generation of reordering list to be made by the software on its own.

Recipe suggest

In this software user would be providing information of what vegetables meat or product he or she is having in fridge on basis of this one has to search text file and specify recipe, which can be made with available ingredients.
