pandas

An introduction

Ву

Amar Panchal | 9821601163

Amar Panchal 9821601163 www.amarpanchal.com

Python Pandas

- Pandas is an open-source Python Library providing high-performance data manipulation and analysis tool using its powerful data structures. The name Pandas is derived from the word Panel Data - an Econometrics from Multidimensional data.
- ▶ 2008, developer Wes McKinney started developing pandas when in need of high performance, flexible tool for analysis of data.

Amar Panchal

9821601163

Key Features of Pandas

- ▶ Fast and efficient DataFrame object with default and customized indexing.
- Tools for loading data into in-memory data objects from different file formats.
- Data alignment and integrated handling of missing data.
- Reshaping and pivoting of date sets.
- Label-based slicing, indexing and subsetting of large data sets.
- ▶ Columns from a data structure can be deleted or inserted.
- Group by data for aggregation and transformations.
- High performance merging and joining of data.
- Time Series functionality.

Amar Panchal

9821601163

www.amarpanchal.com

Before we start

> Standard Python distribution doesn't come bundled with Pandas module.

pip install pandas

For using pandas

Import panadas as pd

Amar Panchal

9821601163

Data structures

- Series
- DataFrame
- Panel

Dimension & Description

Data Structure	Dimensions	Description	
Series	1	1D labeled homogeneous array, sizeimmutable.	
Data Frames	2	General 2D labeled, size-mutable tabular structure with potentially heterogeneously typed columns.	
Panel	3	General 3D labeled, size-mutable array.	
Amar Panchal	9821601163	www.amarpanchal.com	

Python Libraries for Data Science Many popular Python toolboxes/libraries: NumPy All these libraries SciPy are installed on the Pandas SCC SciKit-Learn Visualization libraries matplotlib Seaborn and many more ... www.amarpanchal.com Amar Panchal 9821601163

Python Libraries for Data Science

NumPy:

- introduces objects for multidimensional arrays and matrices, as well as functions that allow to easily perform advanced mathematical and statistical operations on those objects
- provides vectorization of mathematical operations on arrays and matrices which significantly improves the performance
- many other python libraries are built on NumPy

Link: http://www.numpy.org/

Amar Panchal 9821601163

www.amarpanchal.com

Python Libraries for Data Science

SciPy:

- collection of algorithms for linear algebra, differential equations, numerical integration, optimization, statistics and more
- part of SciPy Stack
- built on NumPy

Link: https://www.scipy.org/scipylib/

Amar Panchal 9821601163

Python Libraries for Data Science

learn

pandas

Pandas:

- adds data structures and tools designed to work with table-like data (similar to Series and Data Frames in R)
- provides tools for data manipulation: reshaping, merging, sorting, slicing, aggregation etc.
- allows handling missing data

Link: http://pandas.pydata.org/

Amar Panchal 9821601163

www.amarpanchal.com

Python Libraries for Data Science

SciKit-Learn:

- provides machine learning algorithms: classification, regression, clustering, model validation etc.
- built on NumPy, SciPy and matplotlib

Link: http://scikit-learn.org/

Amar Panchal 9821601163

Python Libraries for Data Science

matpl&tlib

matplotlib:

- python 2D plotting library which produces publication quality figures in a variety of hardcopy formats
- a set of functionalities similar to those of MATLAB
- line plots, scatter plots, barcharts, histograms, pie charts etc.
- relatively low-level; some effort needed to create advanced visualization

Link: https://matplotlib.org/

Amar Panchal 9821601163

www.amarpanchal.com

Python Libraries for Data Science

Seaborn:

- based on matplotlib
- provides high level interface for drawing attractive statistical graphics
- Similar (in style) to the popular ggplot2 library in R

Link: https://seaborn.pydata.org/

Amar Panchal 9821601163

Loading Python Libraries

```
In [ #Import Python Libraries
]: import numpy as np
import scipy as sp
import pandas as pd
import matplotlib as mpl
import seaborn as sns
```

Press Shift+Enter to execute the jupyter cell

Amar Panchal

9821601163

www.amarpanchal.com

Reading data using pandas

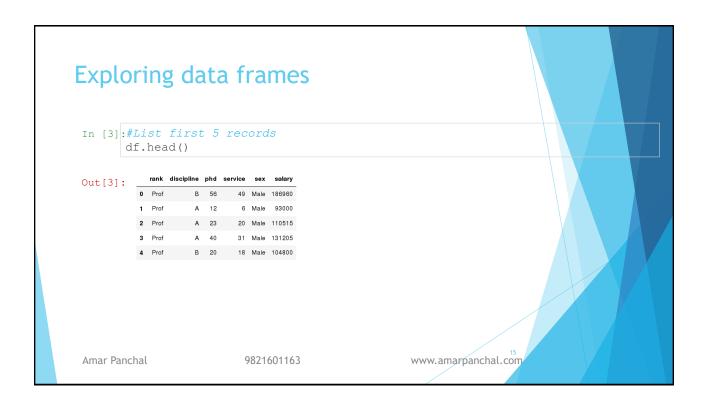

```
In [ ]:#Read csv file
df = pd.read csv("http://rcs.bu.edu/examples/python/data analysis/Salaries.csv")
```

Note: The above command has many optional arguments to fine-tune the data import process.

There is a number of pandas commands to read other data formats:

```
pd.read_excel('myfile.xlsx',sheet_name='Sheet1', index_col=None, na_values=['NA'])
pd.read_stata('myfile.dta')
pd.read_sas('myfile.sas7bdat')
pd.read_hdf('myfile.h5','df')

Amar Panchal 9821601163 www.amarpanchal.com
```

Data Frame data types Pandas Type Native Python Type

Pandas Type	Native Python Type	Description	
object	string	The most general dtype. Will be assigned to your column if column has mixed types (numbers and strings).	
int64	int	Numeric characters. 64 refers to the memory allocated to hold this character.	
float64	float	Numeric characters with decimals. If a column contains numbers and NaNs(see below), pandas will default to float64, in case your missing value has a decimal.	
datetime64, timedelta[ns] Amar Manchal	N/A (but see the <u>datetime</u> module in Python's standard library)	Values meant to hold time data. Look into these for time series experiments. 16 www.amarpancnat.com	

```
Data Frame data types
 In [4]:#Check a particular column type
       df['salary'].dtype
Out[4]: dtype('int64')
In [5]: #Check types for all the columns
       df.dtypes
Out[4]:rank
                    object
       discipline
                    object
                    int64
       phd
                    int64
       service
                    object
       sex
                    int64
       salary
       dtype: object
 Amar Panchal
                          9821601163
                                                    www.amarpanchal.com
```

Data Frames attributes Python objects have attributes and methods. df.attribute description dtypes list the types of the columns columns list the column names list the row labels and column names axes ndim number of dimensions size number of elements shape return a tuple representing the dimensionality values numpy representation of the data Amar Panchal 9821601163 www.amarpanchal.com

Data Frames methods

Unlike attributes, python methods have parenthesis.

All attributes and methods can be listed with a dir() function:

dir	(df))_

df.method()	description
head([n]), tail([n])	first/last n rows
describe()	generate descriptive statistics (for numeric columns only)
max(), min()	return max/min values for all numeric columns
mean(), median()	return mean/median values for all numeric columns
std()	standard deviation
sample([n])	returns a random sample of the data frame
dropna()	drop all the records with missing values

Selecting a column in a Data Frame

Method 1: Subset the data frame using column name:

df['sex']

Method 2: Use the column name as an attribute:

df.sex

Note: there is an attribute *rank* for pandas data frames, so to select a column with a name "rank" we should use method 1.

Amar Panchal

9821601163

Data Frames groupby method

Using "group by" method we can:

- · Split the data into groups based on some criteria
- Calculate statistics (or apply a function) to each group
- Similar to dplyr() function in R

Data Frames groupby method

Once groupby object is create we can calculate various statistics for each

```
Ingroup ('rank') [['salary']].mean()

salary

rank

AssocProf 91786.230769

AsstProf 81362.789474

Prof 123624.804348
```

Note: If single brackets are used to specify the column (e.g. salary), then the output is Pandas Amar Pansames object. When double objects when double objects are used the output is man pansame to be salary).

Data Frames groupby method

groupby performance notes:

- no grouping/splitting occurs until it's needed. Creating the *groupby* object only verifies that you have passed a valid mapping
- by default the group keys are sorted during the *groupby* operation. You may want to pass sort=False for potential speedup:

Amar Panchal

9821601163

www.amarpanchal.com

Data Frame: filtering

To subset the data we can apply Boolean indexing. This indexing is commonly known as a filter. For example if we want to subset the rows in which the salary value is greater than \$120K:

```
In []:#Calculate mean salary for each professor rank:
    df_sub = df[ df['salary'] > 120000 ]
```

Any Boolean operator can be used to subset the data:

```
> greater; >= greater or equal;
< less; <= less or equal;
== equal; != not equal;</pre>
```

```
In []:#Select only those rows that contain female professors:

Amar Pane falf = df[ df['sex2160+763'Female'] www.amarpanchal.com
```

Data Frames: Slicing

There are a number of ways to subset the Data Frame:

- one or more columns
- one or more rows
- a subset of rows and columns

Rows and columns can be selected by their position or label

Amar Panchal

9821601163

www.amarpanchal.com

Data Frames: Slicing

When selecting one column, it is possible to use single set of brackets, but the resulting object will be a Series (not a DataFrame):

```
In [ ]:#Select column salary:
     df['salary']
```

When we need to select more than one column and/or make the output to be a DataFrame, we should use double brackets:

```
In [ ]:#Select column salary:
     df[['rank','salary']]
```

Amar Panchal

9821601163

Data Frames: Selecting rows

If we need to select a range of rows, we can specify the range using ":"

```
In [ ]:#Select rows by their position:
    df[10:20]
```

Notice that the first row has a position 0, and the last value in the range is omitted:

So for 0:10 range the first 10 rows are returned with the positions starting with 0 and ending with 9

Amar Panchal

9821601163

www.amarpanchal.com

Data Frames: method loc

If we need to select a range of rows, using their labels we can use method loc:

```
In []:#Select rows by their labels:
df_sub.loc[10:20,['rank','sex','salary']]

rank sex salary

Out[]:

rank sex salary

10 Prof Male 128250

11 Prof Male 134778

13 Prof Male 162200

14 Prof Male 153750

15 Prof Male 150490

19 Prof Male 150500

Amar Panchal 9821601163 www.amarpanchal.com
```

Data Frames: method iloc

If we need to select a range of rows and/or columns, using their positions we can use method iloc:

```
In [ ]:#Select rows by their labels:
         df sub.iloc[10:20,[0, 3, 4, 5]]
           rank service
                       sex salary
        26 Prof 19 Male 148750
Out[] 27 Prof
                  43 Male 155865

                                                                  www.amarpanchal.com
         45 Prof
                  25 Female 140096
```

Data Frames: method iloc (summary)

```
df.iloc[0] # First row of a data frame
df.iloc[i] #(i+1)th row
df.iloc[-1] # Last row

df.iloc[:, 0] # First column
df.iloc[:, -1] # Last column

df.iloc[:, 0:2] #First 7 rows
df.iloc[:, 0:2] #First 2 columns
df.iloc[1:3, 0:2] #Second through third rows and first 2 columns
df.iloc[[0,5], [1,3]] #1st and 6th rows and 2nd and 4th columns

Amar Panchal 9821601163 www.amarpanchal.com
```

Data Frames: Sorting

We can sort the data by a value in the column. By default the sorting will occur in ascending order and a new data frame is return.

```
In []:# Create a new data frame from the original sorted by the column Salar
       df sorted = df.sort values( by ='service')
       df sorted.head()
          rank discipline phd service
Out[]
       17 AsstProf
      12 AsstProf B 1 0 Male 88000
Amar Panchal
                          9821601163
                                                     www.amarpanchal.com
```

Data Frames: Sorting

42 AsstProf

Amai 68 AsstProf

We can sort the data using 2 or more columns:

2 Female 80225

2 Female 77500

```
In [ ]:df_sorted = df.sort_values( by =['service', 'salary'], ascending = [True, False])
       df sorted.head(10)
Out[] 52
                             0 Female 105000
        17 AsstProf
                                Male 92000
        23 AsstProf
                               Male 85000
        55 AsstProf
```

Missing Values

Missing values are marked as NaN

```
In [ ]:# Read a dataset with missing values
flights = pd.read_csv("http://rcs.bu.edu/examples/python/data_analysis/flights.csv")
```

In []:# Select the rows that have at least one missing value
flights[flights.isnull().any(axis=1)].head()

year month day dep_time dep_delay arr_time arr_delay carrier tailnum flight origin dest air_time distance hour minute **330** 2013 1807.0 29.0 2251.0 UA N31412 1228 403 2013 404 2013 NaN NaN NaN NaN AA N3EVAA 1925 NaN **855** 2013 UA N12221 1299 **858** 2013 NaN NaN 2475 NaN NaN

Amar Panchal 9821601163 www.amarpanchal.com

Missing Values

There are a number of methods to deal with missing values in the data frame:

df.method()	description
dropna()	Drop missing observations
dropna(how='all')	Drop observations where all cells is NA
dropna(axis=1, how='all')	Drop column if all the values are missing
dropna(thresh = 5)	Drop rows that contain less than 5 non-missing values
fillna(0)	Replace missing values with zeros
isnull()	returns True if the value is missing
notnull()	Returns True for non-missing values

Missing Values

- When summing the data, missing values will be treated as zero
- If all values are missing, the sum will be equal to NaN
- cumsum() and cumprod() methods ignore missing values but preserve them in the resulting arrays
- Missing values in GroupBy method are excluded (just like in R)
- Many descriptive statistics methods have skipna option to control if missing data should be excluded. This value is set to True by default (unlike R)

Amar Panchal

9821601163

Aggregation Functions in Pandas

Aggregation - computing a summary statistic about each group, i.e.

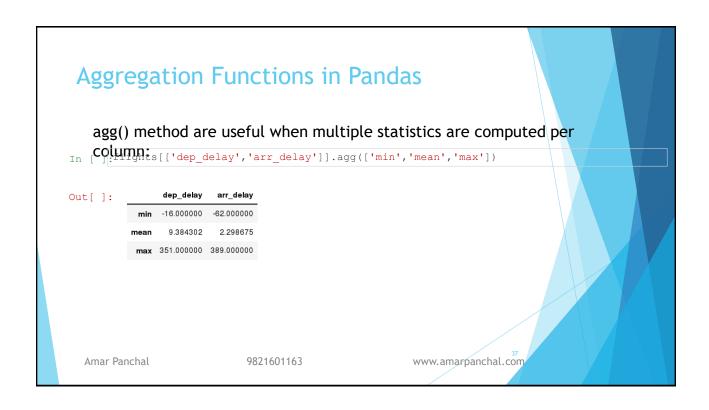

- · compute group sums or means
- · compute group sizes/counts

Common aggregation functions:

min, max count, sum, prod mean, median, mode, mad std, var

Amar Panchal

9821601163

Basic Descriptive Statistics df.method() description describe Basic statistics (count, mean, std, min, quantiles, Minimum and maximum values min, max Arithmetic average, median and mode mean, median, mode Variance and standard deviation var, std Standard error of mean sem skew Sample skewness kurt kurtosis Amar Panchal 9821601163 www.amarpanchal.com

Graphics to explore the data

Seaborn package is built on matplotlib but provides high level interface for drawing attractive statistical graphics, similar to ggplot2 library in R. It specifically targets statistical data visualization

To show graphs within Python notebook include inline directive:

In []:%matplotlib inline

Amar Panchal

9821601163

www.amarpanchal.com

Graphics

Amar Panchal

	description
distplot	histogram
barplot	estimate of central tendency for a numeric variable
violinplot	similar to boxplot, also shows the probability density of the data
jointplot	Scatterplot
regplot	Regression plot
pairplot	Pairplot
boxplot	boxplot
swarmplot	categorical scatterplot
factorplot	General categorical plot

9821601163

Series

- > Series is a one-dimensional array like structure with homogeneous data.
- Series is a one-dimensional labeled array capable of holding data of any type (integer, string, float, python objects, etc.). The axis labels are collectively called index.
- Key Points
 - Homogeneous data
 - Size Immutable
 - Values of Data Mutable

Amar Panchal

9821601163

www.amarpanchal.com

Creating series

import pandas as pd

s = pd.Series()

print (s)

s=pd.Series(data=[10,20,30,40,50],index=['a','b','c','d','e'])

Access

Default:0 to n

Labaled: a to e

Negative index: -1 to -n

Amar Panchal

9821601163

Creating Series with Dictionary

▶ Create a Series from dict

```
import pandas as pd
data = {'one': 1, 'two': 2, 'three': 3}
s = pd.Series(data)
print s
```

Amar Panchal

9821601163

www.amarpanchal.com

Creating Series with Scalar value

ightharpoonup s = pd.Series(6, index=[0, 1, 2, 3,4])

Amar Panchal

9821601163

Loading CSV file

#CSV READABLE

import pandas as pd
df = pd.read_csv("book1.csv")
ser = pd.Series(df['NAME'])
data = ser.head(10)

print(data)

- ▶ .loc[start:end] ---→labled
- ▶ .iloc[start:end]--→index integer

Amar Panchal

9821601163

www.amarpanchal.com

Operations

FUNCTION	DESCRIPTION
add()	Method is used to add series or list like objects with same length to the caller series
sub()	Method is used to subtract series or list like objects with same length from the caller series
mul()	Method is used to multiply series or list like objects with same length with the caller series
div()	Method is used to divide series or list like objects with same length by the caller series
sum()	Returns the sum of the values for the requested axis
prod()	Returns the product of the values for the requested axis
mean()	Returns the mean of the values for the requested axis
pow()	Method is used to put each element of passed series as exponential power of caller series and returned the results
abs()	Method is used to get the absolute numeric value of each element in Series/DataFrame
COV()	Method is used to find covariance of two series www.amarpanchat.com

Pandas Series.add()

- **Syntax:** Series.add(other, level=None, fill_value=None, axis=0)
- Parameters:

other: other series or list type to be added into caller series fill_value: Value to be replaced by NaN in series/list before adding level: integer value of level in case of multi index

Return type: Caller series with added values

Amar Panchal

9821601163

www.amarpanchal.com

Conversion Operation on Series

▶ In conversion operation we perform various operation like changing datatype of series, changing a series to list etc. In order to perform conversion operation we have various function which help in conversion like .astype(), .tolist() etc.

Amar Panchal

9821601163

DataFrame

- A Data frame is a two-dimensional data structure, i.e., data is aligned in a tabular fashion in rows and columns.
- Features of DataFrame
- Potentially columns are of different types
- Size Mutable
- Labeled axes (rows and columns)
- ▶ Can Perform Arithmetic operations on rows and columns
- USE: pandas.DataFrame
- pandas.DataFrame(data, index, columns, dtype, copy) Create DataFrame
- A pandas DataFrame can be created using various inputs like -
 - Lists
 - dict
 - Series

Amar Ranchal hdarrays

9821601163

www.amarpanchal.com

Row Selection, Addition, and Deletion

- Selection by Label
 - ▶ Rows can be selected by passing row label to a **loc** function.
- Selection by integer location
 - ▶ Rows can be selected by passing integer location to an **iloc** function.
- Slice Rows
 - ▶ Multiple rows can be selected using ': ' operator.
- Addition of Rows
 - Add new rows to a DataFrame using the append function. This function will append the rows at the end.
- Deletion of Rows
 - Use index label to delete or drop rows from a DataFrame. If label is duplicated, then multiple rows will be dropped.

Amar Panchal

9821601163

Panel

- A panel is a 3D container of data. The term Panel data is derived from econometrics and is partially responsible for the name pandas pan(el)-da(ta)-s.
- ► The names for the 3 axes are intended to give some semantic meaning to describing operations involving panel data.
 - ▶ items axis 0, each item corresponds to a DataFrame contained inside.
 - major_axis axis 1, it is the index (rows) of each of the DataFrames.
 - minor_axis axis 2, it is the columns of each of the DataFrames.

Amar Panchal

9821601163

www.amarpanchal.com

Visualization

- Pip install matplotlib(needed)
- Various types of data visualization matpolotlib provides are :
- Lines, bars and markers
- Images, contours & fields
- ▶ Pie & polar charts
- Statistical level Plotting

Amar Panchal

9821601163

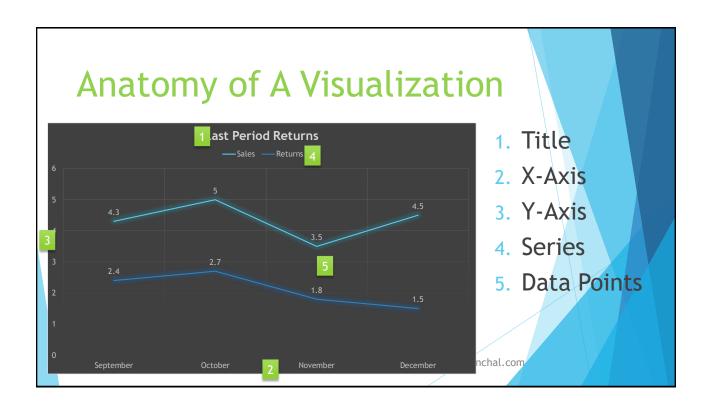

Connect Activity Question: What is the purpose of a data visualization? A. Find relationships in data B. Find patterns in data C. Discover meaning in data D. All of the above Amar Panchal 9821601163 www.amarpanchal.com 8 C D 0
